Occupancy Modeling for an Imperiled Watersnake

Lauren Hall & Dr. Bruce Kingsbury

Introduction

•**Copper-bellied Watersnake:**
endangered in IN, MI, & OH,
federally listed as threatened

•**Northern Watersnake:**
congener, common in
CWS range

•**Northern Ribbon Snake:**
widespread in CWS range

•**Occupancy modeling:** used to estimate species
occupancy, detection probabilities, and patch colonization
& extinction rates between seasons

Objective

Use occupancy modeling to compare Ψ , p , γ , and ϵ
among the three species (CWS, NWS, and NRS)

Methods

- Study site: 12 wetland complexes with past CWS
observations
- 3 visual encounter surveys per complex per year, 2013
& 2014
- Observations of 3 species made into detection
histories (detection = 1, nondetection = 0)
- Program PRESENCE used to make models from
detection histories, and select models that best fit data

Key to Acronyms and Variables

CWS = Copper-bellied Watersnake = *Nerodia erythrogaster neglecta*

NWS = Northern Watersnake = *N. sipedon sipedon*

NRS = Northern Ribbon Snake = *Thamnophis sauritus septentrionalis*

Ψ = occupancy probability = fraction of habitat patches occupied

p = detection probability = probability of detecting an organism if the site is actually occupied

γ = colonization rate = probability of unoccupied site becoming occupied between seasons

ϵ = extinction rate = probability of occupied site becoming unoccupied between seasons

Results

•Best model for all species: $\Psi(\cdot), \gamma(\cdot), \epsilon(\cdot), p(\text{year})$

Discussion

- Differences in p between years due to observer skill or
difference in survey timing (1-2 weeks later in 2014)
- 2014: p similar for all species; in 2013 CWS much less likely
to be detected at occupied sites than other species
- NRS occupies 9.6/10 sites, NWS 8.4/10, CWS only 3.8/10
- Difference in CWS and NWS Ψ may be due to species
biology which impacts relative species abundance

Conclusions

- As expected, NRS & NWS had higher Ψ than endangered CWS
- Differences in p between CWS and NWS weren't significantly
different, indicating less frequent CWS observations indicate
actual rarity, not non-detection
- More analysis needed to deduce cause of yearly variation in p

Future Research

- Models for all species ( ,  , )
- Run 2-species models (CWS & NWS, CWS & prey species)
- Determine effects of habitat on occupancy
- Use ϵ and γ to predict CWS abundance in future
